PFAS Free RJ Schinner

What is PFAS?

(per-and polyfluoroalkyl substances, aka "forever chemicals")

PFAS are synthetic chemicals that are hard to break down and last a long time — hence the "forever" in their nickname. They are widely used in consumer products because they are resistant to grease, oil, water and heat.

Aside from food packaging, they are also used in nonstick cookware, household products and even bottled water and Fire extinguishers, carpets, rugs, cosmetics, children's products, Athletic turf fields, Ski wax, Textiles, Fabric treatments and stain fighters, personal care and Feminine products, paints, stains, polishes and floor products, automotive products, sealants. Nail polish, floss and shampoos.

Because this is seeping into our waterways and our soil, in some places it is cautioned to not drink the water and or eat deer or fish. In certain areas, they are advising to not consume beef.

Aside from not being good for the environment, PFAS exposure has been linked to health problems in humans, ranging from immune system suppression to increased risk for some cancers, reproductive issues and many more.

Food Service items that could have PFAS in them:

Anything that has a grease resistance coating – and/or to be used to bind the plant material together.
