

Monkeypox

Monkeypox is a viral disease that normally starts with flu-like symptoms, including fever, chills, a headache, and achy muscles, with a rash usually then developing after 1 to 3 days. The rash typically progresses, beginning as flat spots that develop into bumps, which fill with fluid. Monkeypox is primarily spread through sustained physical contact such as skin-to-skin touch with someone who has an active rash. Respiratory spread is not the predominant worry.

Currently, there is no product on the market that has been tested against Monkeypox.

Emerging Viral Pathogen Claims:
