

Extends Life of Metalware

Baked-on carbon residue is a stubborn problem for anyone who prepares meals, especially in large capacity kitchens. Removing these heavy soils can be messy, difficult, and even toxic.

CARBrid is a revolutionary formula that easily removes carbon build-up, allowing you to rescue your older pots and pans that might otherwise need to be replaced.

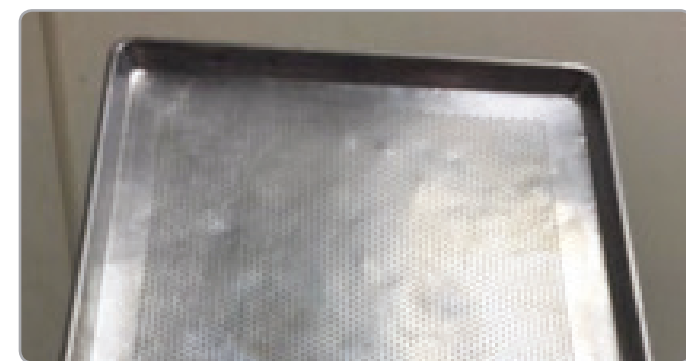

Image counts!

Appearance matters to your guests, your employees, and to anyone who enters your facility.

Whether it's a commercial kitchen, an extended stay hotel, or a time share resort, carbon staining on your pots and pans leaves a bad impression.

CARBrid effectively removes baked-on carbon.

Carbon is the Problem

In the past you may have been forced to scrub with toxic, even cancer-causing solutions.

CARBrid's safer formula does not contain Methylene Chloride, a known carcinogen, that is used in traditional carbon removal cleaning solutions.

NOT FOR USE ON: Painted surfaces, plastics, acrylics, Corian® sinks and countertops, Anolon® surfaces, Calphalon® or Teflon™ non-stick pans. *CARBrid is not intended for use as a general-purpose cleaner / degreaser.*

CARBrid is the Solution

Easy to Use

CARBrid is a thickened formula - simply pour onto the surface, paint on for full coverage, and let dwell for a as little as 15 minutes, or overnight for heavy duty cleaning. The carbon will peel or rinse right off!

Versatile

CARBrid is safe on all metals, and can be used on:

- Baking pans
- Cast iron
- Frying pans
- Copper
- Aluminum
- Storage racks
- Stainless steel
- Stove tops

**Don't Buy New Pans
REVIVE THEM**
